

Goal Learn about the following terminology: schedule, digraph, processors, finishing time, optimal finishing time, idle time, critical path, critical time.

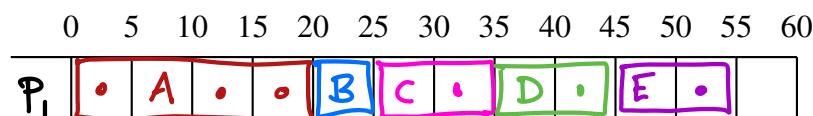

1. Motivating Example Fixing a Flat Bike Tire

label	task	time	dependence
A	buy a replacement tube patch kit	20 minutes	
B	find tools	5 minutes	
C	remove tire and tube	10 minutes	
D	replace tire and new tube	10 minutes	
E	repair old tube	10 minutes	

(a) Schedule with one processor

total time: 55 min

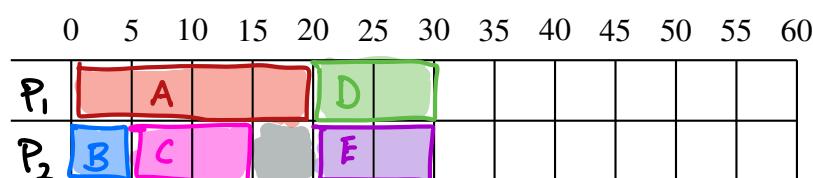

(b) Schedule with two processors

total time: 30 min

← 25 minutes faster with 2 processors!

time	0	5	15	20	30							
done	B	C	A		D, E							
ready	A, B	C	D E									

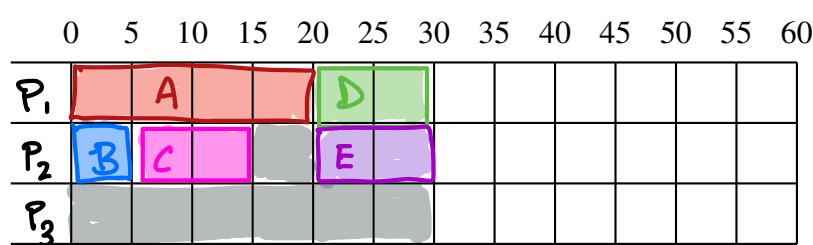

↑ 5 minutes idle time

(c) Schedule with three processors

total time: 30 min

time	0	5	15									
done	B	C										
ready	A, B	C	D E									

Idle!

More processors
doesn't necessarily
make things go
faster!

2. Terminology

(a) schedule

An ordering of tasks that match dependencies

(b) digraph

Model where
 • vertices are tasks
 • vertices are labeled w/time

- arrow (directed edge) from $V \rightarrow W$ if task W can't be started until V is completed

(c) processors

people/machines/entities completing tasks

(d) finishing time

time to complete all the tasks

(e) optimal finishing time and optimal schedule

shortest finishing time / schedule that completes in the shortest possible time

(f) idle time

time when processors are not completing tasks

(g) critical path

the longest path in the digraph, measured by summing time = vertex weights

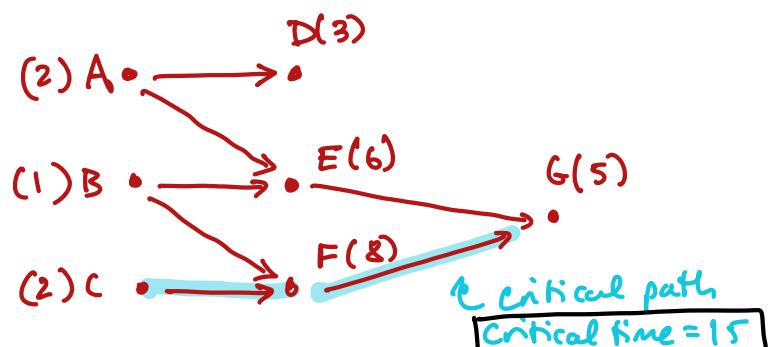

* Shortest possible time, no matter how many processors!

(h) critical time

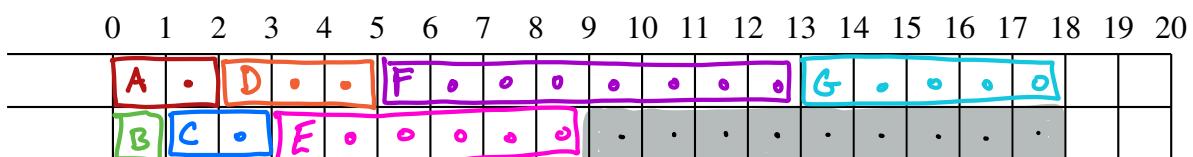

length (sum of weights) of the critical path.

3. General Example: Create a digraph. Make a valid schedule with TWO processors. Determine values of finishing time, idle time and critical time.

label/task	time	dependence
A	2	
B	1	
C	2	
D	3	A
E	6	A, B
F	8	B, C
G	5	E, F

time	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
done																			
ready	A, B, C		D, E	F															

Finishing time = 18

9 units of idle time!
